Firearm and DNA Swab Submission Guidelines

Firearm Processing Protocol

- Unless otherwise directed by the submitting agency, the NJSP Crime Scene Investigations Unit (CSI) will examine firearms for any trace or biological evidence. The firearm will be examined for fingerprints utilizing the ForenScope Mobile Multispectral Imaging System and/or other fingerprinting methods. Any identifiable fingerprints will be captured either digitally or through manual fingerprint processing. Upon the completion of the fingerprinting process the firearm will be swabbed for possible DNA. NIBIN analysis will then follow these steps.
- CSI will typically collect one (1) swab from the firearm and one (1) swab from the magazine. If an area of suspected blood is observed, the stained area will be swabbed and listed as a possible blood stain.
- **Cartridge casings will no longer be routinely processed for latent fingerprints as the surface area is not conducive to leaving identifiable prints.** Exceptions to this policy may be made on a case by case basis.

Requirements for DNA analysis:

- DNA analysis of firearm swabs requires **pre-approval** from the DNA Laboratory. The swabs collected by CSI will be returned to the submitting agency, **without DNA analysis**, if pre-approval is not received.
- When submitting swabs directly to the laboratory for DNA testing, the same protocol as that used by NJSP CSI should be followed. Only one (1) swab from firearm and one (1) swab from magazine will be accepted for analysis, unless a stain is observed. **Swabbing of cartridge casings will not be routinely performed.** Refer to the **NJSP Evidence Field Manual** for firearm swabbing recommendations or contact the laboratory.
- The following swabs are not routinely accepted: swabs from firearms taken directly from an individual, swabs from firearms handled by law enforcement officer(s) (LEO) without gloves* or swabs from casings/unfired ammunition.

*This scenario requires the submittal of a DNA reference sample from LEO at the time of submission.

DNA analysis is predicated on the eligibility requirements of the Combined DNA Index System (CODIS)

- **Firearm possession** related offenses or found firearms are **not** CODIS eligible and DNA analysis will be denied, without further information. If applicable, list all offenses that may affect CODIS eligibility (i.e., CDS distribution, eluding, assault, etc.)
- Qualified offender profiles in the CODIS database cannot be searched against DNA profiles developed from evidence (including firearms) that is not eligible for CODIS entry.
- A **direct comparison** to a DNA profile recovered from CODIS ineligible evidence can be conducted with the submission of a DNA reference sample from the suspect.

Brief History is required for all submission requests.

- Include description of event, where the firearm was recovered, and if the firearm has been identified as stolen. Immediately contact the laboratory with **NIBIN/AFIS** hit documentation once obtained.
- **If firearm is recovered from a residence:**
 - Include the firearm location. If related to CDS offenses, include proximity to CDS.
- **If firearm is recovered from a vehicle:**
 - Include the name of the registered owner/primary driver of the vehicle and firearm recovery location. If related to CDS offenses, include proximity to CDS. Indicate if the vehicle was stolen or used during the commission of another offense such as robbery, etc.
